

THE HARRISON STORY

THOMAS HARRISON started his own business in Rochdale in 1861, and moved to Durham in 1872. Thomas's sons took over in 1896, with Harry designing the organs, and Arthur becoming a voicer of legendary vision and perfectionism. Arthur died in 1936, and Harry retired shortly after the War, leaving the firm in the hands of his son Cuthbert. Mark Venning succeeded Cuthbert Harrison as Managing Director in 1975. He is a past President of the International Society of Organbuilders. In 2017, Andrew Reid became Managing Director; Mark Venning continues as Chairman.

EVOLUTION. Our early organs all had tracker action, and many are still in excellent working order a century later. The main principles of our work have not changed in 150 years, but our techniques have evolved, and modern methods of construction have been introduced. We now use bone instead of ivory for keyboards, and electric blowers instead of choirboys for the wind; and our slider chests make allowance for well-heated churches. The firm moved in 1996 to a purpose-built workshop. It is designed around a courtyard allowing natural light for all, and the atmosphere is informal and friendly.

NEW ORGANS. Arthur Harrison would still recognise the colourful and exquisitely-blended sound of a modern Harrison organ. H&H are known for large and distinguished instruments with electro-pneumatic action, and also for excellent organs with tracker action. Even in a busy city church an H&H organ will last many years before needing any significant work. Our 15-year guarantee is just the beginning.

DESIGN work starts with the voicer: the sound of an H&H organ goes hand-in-hand with a good layout. CAD is well established as one of our tools, much appreciated by the designers. Pipes, mechanism, casework and carving are made in our workshop. The firm trains its own craftsmen, many from school-leaving age. An awareness of international trends and techniques has been augmented by interaction with craftsmen from other European countries.

RESTORATION. Our consistently high standards have made us a natural choice for a series of high-profile restorations. The aims of the original builder are of first importance. Restoration can be full of surprises as we rediscover the inventiveness of earlier generations of master organbuilders. We delight in giving new life to historic instruments, both large and small, and restoring the mechanism to work as originally intended. We are specialists in the unusual and highly complex art of pneumatic restoration. We never lose interest in any organ we have built or restored.
